

Dear Customer,

we thank you for your interest towards our brand new downdraft: **Stone.**

This model allows you to customise the cover of the hood with the same material of the worktop, thus obtaining a flush-top effect.

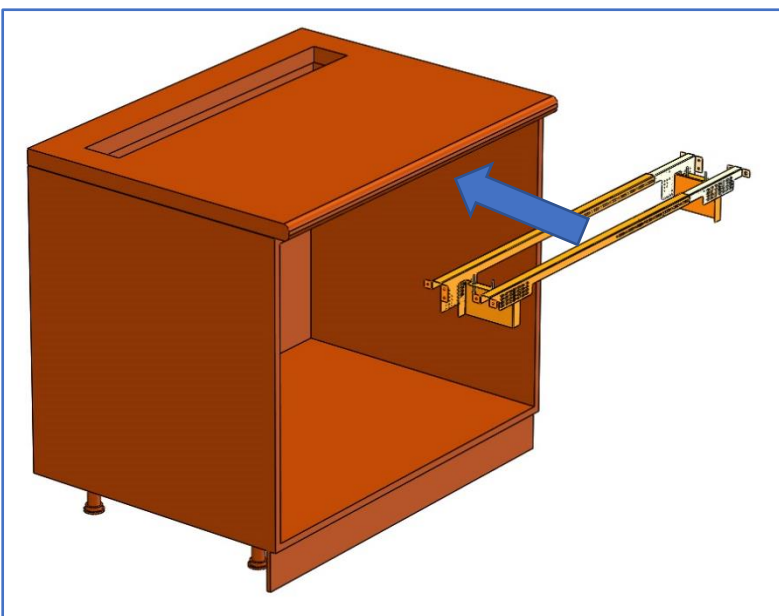

Please, find below further information about its installation.

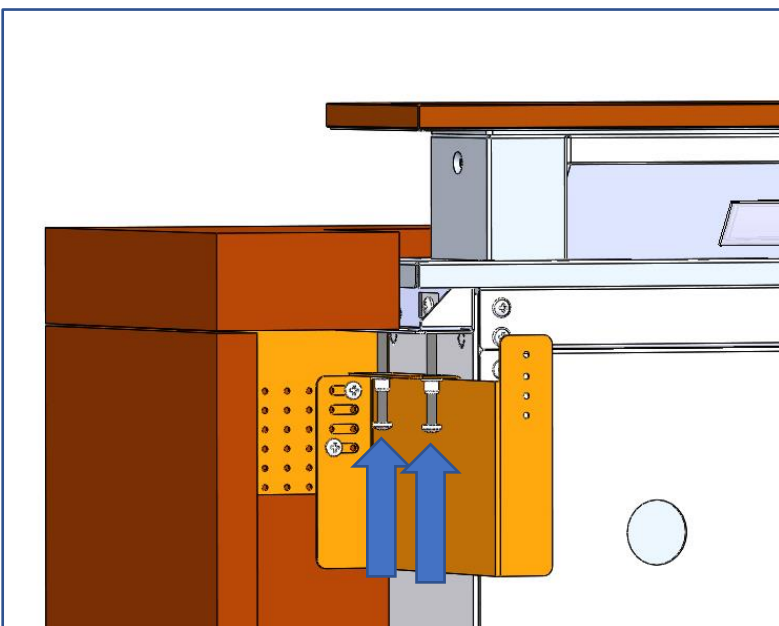

*The Stone 90 EM downdraft is equipped with an adjustable metallic structure to fix under the cabinet.*

*The worktop can be in different materials such as stone, corian, wood, granite, etc.*

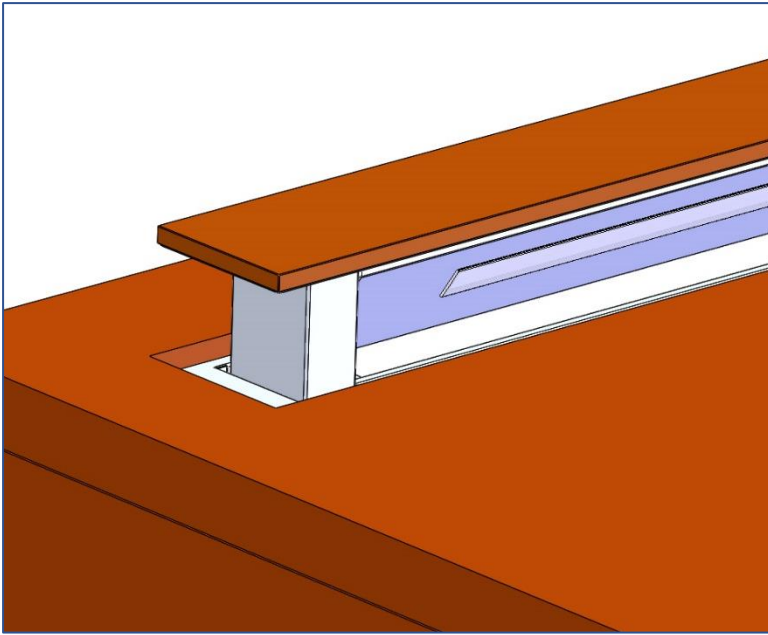

*The metal structure is fixed to the cabinet with 8 screws.*

*Once the metallic structure is installed, you can position the downdraft on it.*

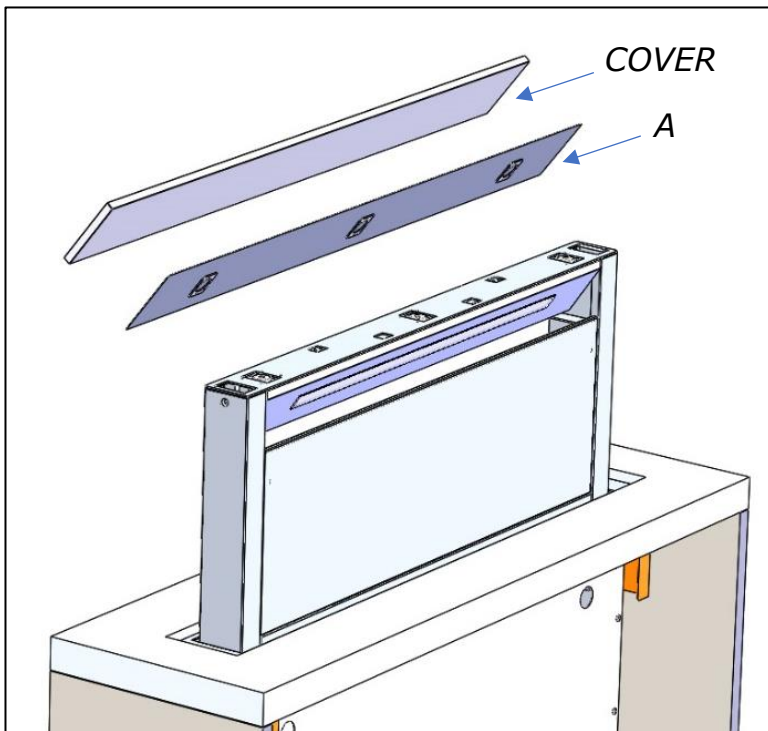

*You can adjust the height of downdraft with the screws (see image attached), regardless of the thickness of the worktop.*

*The range hood slides vertically inside the opening on the worktop.*

*The thickness of the cover to fix on the downdraft can vary since it is possible to adjust the height in order to get a flush top effect with the worktop.*

*We suggest to realize a 10 mm thickness cover in order to get a light, delicate and safer design.*

*Glue the cover on a steel plate (A).*

*Then, cover and steel plate are positioned on the downdraft through 3 or more magnets.*

*This system allows a quick release in case of accidental collision and ensures a quick replacement of the cover in case of damage.*

*We recommend the weight of the cover not to exceed 5 kg.*

At your disposal for further information,  
best regards

Witt Denmark A/S
